

Horizontal - Tilted - Vertical External Blinds

TOP HORIZON is a roller blind system for skylights or glazed roofs in horizontal or sloping positions. The mechanism consists of a double cassette with lateral aluminium guides and rod control with winch or 230 volt or 110 volt motor with switch or wireless control, which can be connected to sun and temperature sensors for automatic operation. The system includes different types of boxes in terms of shape and size depending on the width and length of the blind. The blind can be either filtering or 100% shading. Used on all skylights, Horizon blinds are also the perfect solution for yachts and luxury boats.

TOP GARDEN is an awning system for skylights or glazed roofs, horizontal or inclined, with a mechanism that involves a single roller with box, side aluminium guides and tensioning system inside the terminal.

TOP GARDEN is motor-controlled 230 volt with switch or wireless and can be connected to sun and temperature sensors for automatic operation. The awning is usually filtering or can use a blackout fabric and is considered a relevant component of modern architecture.

Our external sloping blinds give open-air spaces elegance and functionality and are designed to withstand even adverse weather conditions thanks to the use of certified materials. Suitable for all environments, public and private, including historic buildings that by definition require refined solutions, external sloping blinds allow you to enjoy your outdoor spaces to the full.

Also in this case the customer will have the possibility to define the preferred colours in line with his personal taste and the ideal project.

Sunshades are a practical solution that offers solar shading without obscuring the entire room through the inclination of adjustable and stackable aluminium slats. Sunshades are systems that regulate and screen light, offering protection from prying eyes and the possibility of customisation thanks to the choice of slat shape for a pleasant visual effect and movement.

The slats, of different widths depending on the project to be carried out, can be "C", "Z" and "S" shaped as well as standard and in the latter case are equipped with a seal for better closure.

Sunshades – Harrods – Porto Cervo (IT)

The Venetian blind is a solar shading system with a minimalist style and high functionality, mainly used in working environments and able to control solar radiation and reduce the thermal load. It provides thermal and lighting comfort. This installation offers a wide range of colours and also a wide choice of aluminium, micro-perforated aluminium and wooden slats.

Unlike standard solid slats, microperforated slats allow light from outside to filter in more evenly without creating an unpleasant streaking effect on the computer screen or TV screen, for example.

External venetian blinds can be motorised or maintained manually.

Over the years, roller blinds have become an architectural feature that elegantly protects buildings from the sun, whether they are installed outside or inside. This type of solar shading varies according to the type of guide, box and degree of sun filtering and plays an important role in reducing energy consumption. With our complete system of cassettes and mechanisms and fabrics for **New Line Outdoor roller blinds** the fabric is collected on an aluminium roller available in different diameters depending on the size of the blind and the control system.

New Line Outdoor roller blind

Solaris Architettura offers a made-to-measure product, a different solution for every need. Solaris Tende proposes with the same accuracy the standard as the customised.

Unique solutions are created.

The multidisciplinary approach requires the capacity to understand the different technical and aesthetic languages, evaluating objective and subjective factors among which the functionality of the environments under study. The lighting and thermal dynamics of the environments are analysed over the course of the day, the weeks and the seasons.

Solaris, much more than a simple blind!
