

Low-Emissivity Reflective Blinds Metallic - Thermal Blinds

Solaris Architettura offers many models of technical interior blinds including roller and panel blinds with low emissive reflective fabric.

The low emissive fabrics send back inside the heat generated inside the building reducing and avoiding the thermal dispersion with elegant and modern solutions.

The low emissive fabrics proposed in Solaris Architettura solutions are avant-garde products that act as a thermal barrier, limiting the emission of heat inside the premises. For this reason the controlled temperature guarantees a greater comfort reflecting like a mirror heat in winter and freshness in summer and therefore saving in heating and air conditioning.

Thermal insulation

Solaris Architettura offers many models of technical interior blinds including roller and panel blinds with low emissive reflective fabric.

The low emissive fabrics send back inside the heat generated inside the building reducing and avoiding the thermal dispersion with elegant and modern solutions.

The technology behind the creation of metallised thermal blinds makes it possible through PVC coated polyester fabrics with low emissive paints to fix a thermal shield against heat, insulating the interior environment.

Soltis FEEL 99 and 88 and LowE
protect against glare
save up to 40% on air conditioning costs
preserve visibility to the outside

Low-emission roller blind in office space

Solaris Architettura offers tailor-made projects and different solutions for any kind of need.

Thanks to our ability to understand different technical and aesthetic languages and to evaluate objective and subjective factors such as the multiple functionalities of the rooms under study and their light and thermal dynamics throughout the day-week-seasons, our multidisciplinary approach succeeds in satisfying the desires and needs of our customers.

Solaris, much more than a tent!
